

CIGOPHOLA

ALL IN ONE PHOSPHORUS - CALCIUM - BORON

Precision
technologies

Cigophol A is a liquid foliar fertiliser which combines balanced proportions of Phosphorus, Calcium, Boron and trace-elements to improve fruit production and quality. It also contains Nitrogen and Magnesium to provide complete feed during the fruit development period

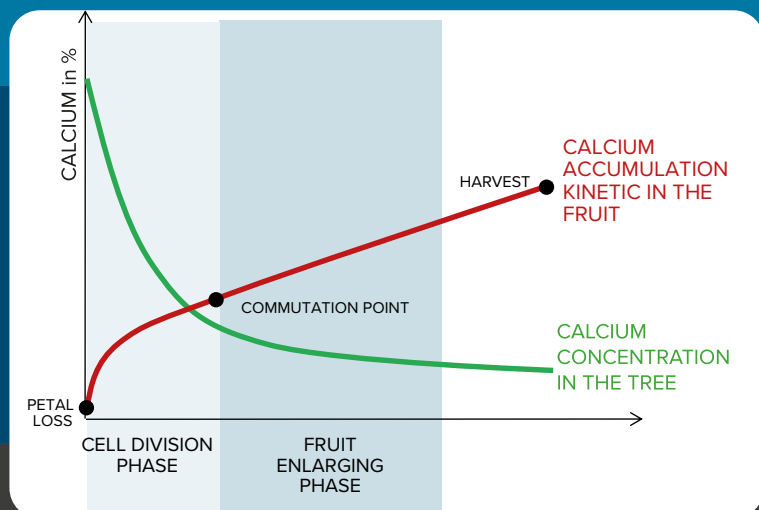

By activating the young fruit's cell division via Phosphorus, CIGOPHOL A increases the quantity of Calcium in the fruit.

The cell division acts like a «Calcium pump». This cell division driving phenomenon must be used to activate the early migration of the Calcium to the young fruit.

Acid pH FORMULATION

- Buffers tank mixtures
- Provides rapid and optimum absorption of all nutrients
- Extremely compatible with most insecticides and fungicides

The Calcium migrates to the fruit during the young fruit's cell division period for 40 days following the loss of the petals (equivalent to a 50 g fruit weight)

Following this period, the Calcium migrates preferentially to the new organs for cell division.
